

Notes: These graphs compare the team results at three local sites on days when the pm 10 objective was breached at Hastings. Data is team not gravimetric. The sites are not directly comparable, you would not expect each site to return the same results but trends should be similar. Eastbourne is a urban background site, Lewes and Hastings are roadside sites adjacent to the A259, however there are approximately 12000 vehicles per day more past the Hastings monitor. The graphs show some correlation between sites on many occasions but also occasions where data has been excluded partly as a result of this comparison process.
